Based

on his experience teaching countless seminars around the world on the Avid Media Composer, Avid Symphony and Avid Xpress, Steve Bayes has written the most comprehensive manual for nonlinear digital editing on these Avid editing systems. This handbook is now revised throughout to reflect recent upgrades to these systems and the third edition covers Symphony 2.1, Media Composer 9.1 and Avid Xpress 3.1, as well as earlier versions. Written for the reader who already has a basic knowledge of the editing systems, this book moves beyond an introduction to the professional Avid editing systems and focuses on strategies, techniques, and troubleshooting. The Avid Handbook covers the basics of working with effects, rendering, and graphics and discusses the more abstract issues of workflow and organization of different types of editing projects. The book discusses frequently made mistakes, common technical problems, and how they can be avoided. In addition, there is an in depth explanation of Symphony color correction, 24 p and other new features and efficiencies in the latest software versions from Avid. The Avid Handbook discusses techniques for Windows NT users, including the most complete description of the offline to online workflow using Avid systems. The Avid Handbook caters to video editors bordering on intermediate who are ready to unleash the full power of the Avid but don't know where to start. Rather than focusing on arcane keystrokes, the book teaches production procedures,

the real key for getting a job done. Time saving, shortcuts, and strategies are emphasized, and the author tackles such real-world problems as set up, keeping a facility running, minimizing crashing, and troubleshooting head on. Bayes has helped thousands to avoid downtime and maximize creative time. Both modern mathematical music theory and computer science are strongly influenced by the theory of categories and functors. One outcome of this research is the data format of denotators, which is based on set-valued presheaves over the category of modules and diaffine homomorphisms. The functorial approach of denotators deals with generalized points in the form of arrows and allows the construction of a

universal concept architecture. This architecture is ideal for handling all aspects of music, especially for the analysis and composition of highly abstract musical works. This book presents an introduction to the theory of module categories and the theory of denotators, as well as the design of a software system, called Rubato Composer, which is an implementation of the category-theoretic concept framework. The application is written in portable Java and relies on plug-in components, so-called rubettes, which may be combined in data flow networks for the generation and manipulation of denotators. The Rubato Composer system is open to arbitrary extension and is freely available under the GPL license. It allows the developer to build specialized rubettes for tasks that are of interest to composers, who in turn combine them to create music. It equally serves music theorists, who use them to extract information from and manipulate musical structures. They may even develop new theories by experimenting with the many parameters that are at their disposal thanks to the increased flexibility of the functorial concept architecture. Two contributed chapters by Guerino Mazzola and Florian Thalmann illustrate the application of the theory as well as the software in the development of compositional tools and the creation of a musical work with the help of the Rubato framework.
